We, the Committee on Farm reports, Submit the following report of Mr. E. B. Emory's Farm. Time of inspection Sept 15th. We will commence with Mr. Emory's wheat. Observing a very marked difference in parts of his Corn ground wheat we were informed by Mr. E of its cause. The land was thin and that on which nothing had been applied was the portion which showed badly in comparison with that which he had treated to a fertilizer of his own manipulation, the two pieces of land being about alike in quality. If the yield is in proportion to present appearance we would advise Mr. E to keep on manipulating fertilizer. His fallow wheat was good. Did not walk over much of it, probably because a keen nor-wester was blowing
