> TOMATOES SHOULD BE WELL CULTIVATED.

Start Working the Rows As Soon As Possible To Preserve Moisture In the Soil.

J. F. MONROE. Maryland Agricultural College.

As soon as possible after setting out i your tomato plants, start the cultiva tor. It is a good plan to cultivate fairly deep, and throw a little soil to loosens the soil, where it was tramped Pier 16 Light St., Baltimore incident to setting the plants, forms a soil mulch to check evaporation, and if the plants were set in furrows, will fill these up level. It is generally considered the most important work ing, therefore, great care should be S.P. TOWNSHEND, ATTORNEY.

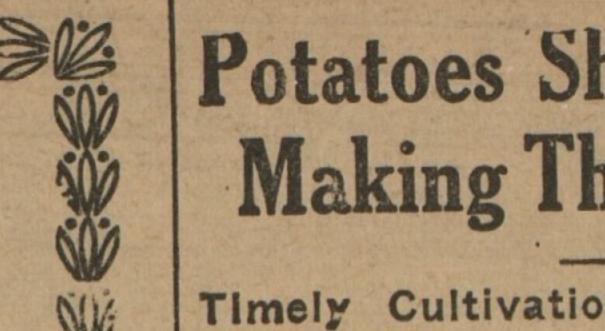

Subsequent cultivations should be frequent and shallow and slightly farther from the plant with each successive working. The frequency of these cultivations will depend some what on seasonal conditions. The grower should work the tomato field lat regular intervals, and after rains, in order to retain the maximum amount of soil moisture for the plants, because

### Potatoes Should Be Making Thrifty Growth

Timely Cultivation Will Kill Weeds While Spraying Will Prevent

T. H. WHITE. Maryland Agricultural Experiment

If potato seed is covered with a condition. A week or two after plant ing, these ridges should be levelled down with a board or clod crusher. Just as the plants appear a smoothing harrow should be used to level the ground and kill the weeds. Very often, especially in late crops, it is not necessary to do any hand hoeing if this harrowing is thorough. Cultivation can be done with an ordinary five shoveled cultivator. Small shovels can be used the first time, stirring the soil deeply. At the last cultivation a lof working in an broad shovel behind will work about | upright. There is the right amount of earth up to the

Spraying to keep off diseases and insects is an important part of potato growing. For insects and diseases af fecting the tops Bordeaux Mixture with either Paris Green or Bordeaux is mostly used. To make Bordeaux Mixture dissolve five pounds of copper sulphate in twenty-five gallons of water, slake also five pounds of good water. Pour both together into the spray barrel. To this may be added eight ounces of Paris Green or three pounds of Arsenate of Lead which will kill the insects.

The spraying should be done thorughly every ten days until the vines begin to mature. When the spraying done mechanically the machine should, if necessary, be driven over the patch several times, or until all the foliage is protected with a coating of spray material.

You will receive a certificate showing the amount of work done in the summer school. This certificate entitles you to due credit for College work done, and to credit on your teach ers certificate.

ROY H. WAITE, Maryland Agricultural Experiment

Dusting a flock of hens by hand to get rid of lice is a laborious and tedious task and is none too efficient un less carefully done. Dig up a little patch of ground about four feet square in front of your poultry house and let your hens dust themselves. They will enjoy the work very much and probably will do a much better job than you can do.

SOY BEANS MAKE VALUABLE MARYLAND CROP.

Improve the Soil and Yield Hay Of High Feeding Quality.

N. E. SCHMITZ, Maryland Agricultural Experiment

Soy beans make a valuable general crop to grow on the average Maryland farm since they both benefit the soil and give a hay of high feeding value, practically equal to alfalfa. They are well adapted to our climate and to most of our soils good varieties that will mature in any section of the State are found on the market.

The soil should be in the same condition and be prepared in the same manner for soy beans as for corn, except that soy beans may be grown in poorer soils than those on which corn can be profitably grown. Soy beans Phone 22 will not grow in very poor sandy land will. On the other hand, soy beans are better suited than are cow peas to the clay soils throughout the State is a clay loam.

Soy beans may be planted from the time corn planting is finished until the middle of July, depending upon the location and what the crop is grown for. In general, the best time is from June 1st to 20th. When a crop of hay is desired, the method of seed Notice is hereby given that the subscriber has obtained from the Orphan's Court of Kent county letters of testamentary on the estate in wheat,—by using the drill. The rate of seeding for hay is about 11/2 bushels

In growing soy beans for seed, they should be planted in rows 24 to 30 inches apart to allow for cultivation as with corn. For this about one-third to one-half bushel of seed per acre is re or before the 15th day of November, 1915, other- quired. The planting may be done with a regular corn planter, or wheat are being grown for the first time, in oculation should be provided for by securing soil from a field in which soy beans have been grown and working into the soil at the rate of three to four

hundred pounds per acre. The principal advantages of soy beans over cow peas are their upright growth, their high and certain seed county letters testamentary on the personal yields, from 15 to 35 bushels per acre, estate in Kent county, Maryland, of less trouble in curing for hay and bet ter hay, and uniform maturing of seed which makes harvesting for seed a simple operation. Where a fair the wheat binder and shocking the winter without much injury from the weather. The threshing is very simple an ordinary wheat thresher will do the Executor. work very effectively, when the cylinrevolutions per minute, but the separator speed must be maintained at the marmal rate as for wheat.
